按照规定，对设备或机器的任何电气或机械部件进行操作之前，ATS 48 的控制 (CL1-CL2) 和电源 (1/L1-3/L2-5/L3) 必须断开。

在运行过程中可以通过取消运行命令使电机停机。起动器保持通电。如果为了人员安全需要禁止突然重起动，则此电气锁定系统是不够的：必须在动力电路上安装一个断路器。

本起动器装有安全设备，当出现故障时，可以停止起动器工作继而使电机停机。电机自身可以通过机械锁定停机。另外，电压变化或电源故障也会导致停机。

如果导致停机的原因消失，则存在重新起动的可能，这将危及某些机器或设备的安全，特别是那些必须符合安全规范的机器或设备。在这种情况下用户必须采取措施预防自动重起动的发生，特别是在电机出现不合程序要求的停机时，要使用低速检测器切断起动器的电源。

本文档中介绍的产品和设备可能会因技术原因随时变更或修改。我们保留更改的权力。

起动器安装和设置必须符合国际和国内标准的要求。系统集成商有责任确保设备的合格性，必须遵守欧盟范围内其他国家的 EMC 规范。

本文档中的技术规范必须遵守，以符合 EMC 条款的基本要求。

ATS 48 必须被视为一个组件，它不是一部已经能够符合欧洲规范的机器或设备（机械规范和电磁兼容性规范）。最终的集成商有责任确保其符合相关的标准。

起动器设置步骤

中文

1、ATS 48 的交货

- 检查印在标签上的起动器型号与定单相对应的提货单上标注的型号是否一致。
- 打开 ATS 48 的包装，确认在运输过程中没有发生损坏。

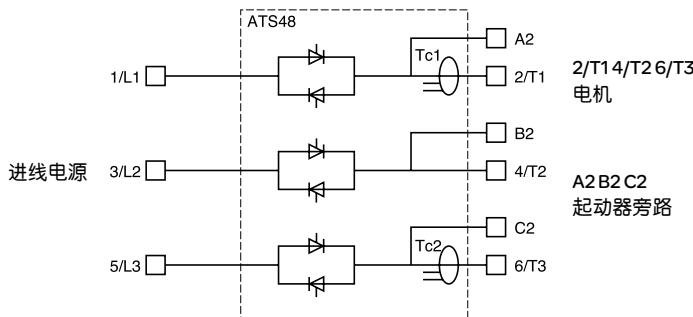

2、根据 20 页和 21 页上的指导安装 ATS 48

3、按如下步骤连接 ATS 48:

- 控制线路电源 (CL1 - CL2)，确保电源断开
- 主电源 (1/L1 - 3/L2 - 5/L3)，确保电源断开
- 电机 (2/T1 - 4/T2 - 6/T3)，确保电机电压与电源电压匹配

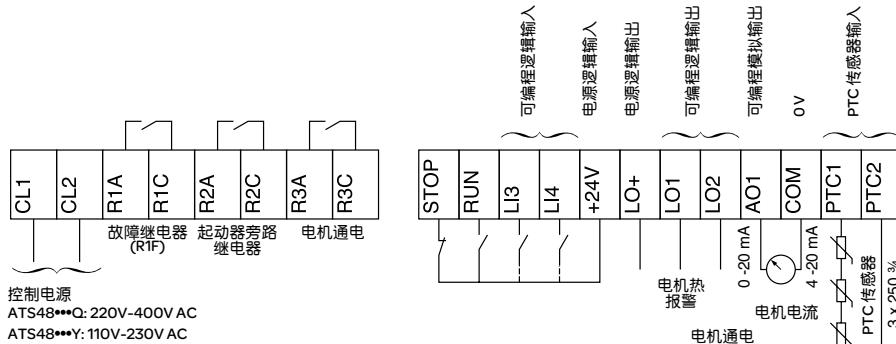

注意：如果使用旁路接触器，应将其连接到电源端的 L1, L2, L3 和 ATS 48 上的端子 A2, B2, C2 上。见 30 页图。如果在电机三角形绕组中使用 ATS48***Q / ATS48***YS316，应遵循 10、11 页的说明以及 31 页的图示。

ATS48 电力部件框图

起动器设置步骤

控制端子的出厂配置：

将故障继电器接点连至电源侧接触器，以便在出现故障时断开电气回路。

详见应用接线图。

连接 RUN (运行) 和 STOP (停止) 命令，如有必要还应连接其他输入 / 输出端子。

Stop 为 1(通) 且 RUN 为 1(通): 起动命令。

Stop 为 0(断) 且 RUN 为 1 或 0: 停机命令。

4、起动 ATS 48 前：

阅读电机铭牌上的信息，以便在 Set 菜单中设定参数 (In)。

5、控制部分 (CL1-CL2) 通电，主电源部分不通电，且不给出运行命令

起动器显示 : nLP (指示电源断开)。

ATS 48 起动器出厂配置用于不需特殊功能的标准应用场合。它具备 10 级的电机保护。

通过改变参数改变设定值，详见第 44 页。

在任何情况下 In 参数都必须设置为电机铭牌上指示的当前值。

6、主电源部分通电 (1/L1-3/L2-5/L3)

起动器显示 : rdY (指示起动器已通电并待机)。

发送一个 “RUN” 命令起动系统。

出厂设定值

如果上述值均符合实际应用，则起动器无须改变设定值即可使用。

初步建议

搬运和存放

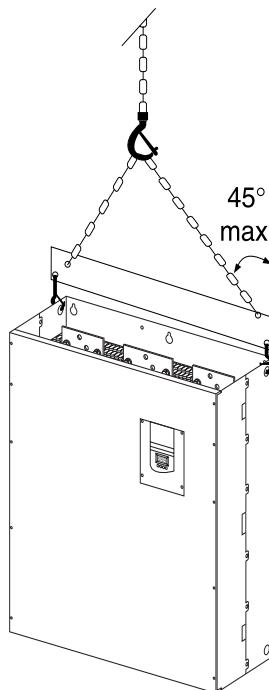

在安装前为保护起动器，应带着包装进行搬运和存放。

安装搬运

ATS 48 系列有 6 种大小的设备，其重量和尺寸各不相同。

小型起动器可以去除包装，无需吊装设备即可安装。

对于大型起动器必须使用吊装设备；为此其上均带有“吊环”。必须遵守如下吊装方式：

不要用电源轨道搬运起动器

操作建议

有效力矩

曲线 T_s 和 I_s 表示异步电机直接起动。

曲线 T_{s1} 表示使用 ATS 48 可获得的总的力矩范围，它取决于限制电流 I_{Lt} 。起动器的逐级起动由此范围内的电机力矩控制。

T_r : 阻力矩, 它必须低于 T_{s1} 力矩。

选择软起动 - 软停止单元

S1 电机负载对应于恒载运行, 允许获得热平衡。

S4 电机负载对应于周期运行, 运行周期由起动、恒载运行和停止过程组成, 该周期由负载系数表示。

必须根据应用类型（“标准”或“重载”）和电机额定功率对 ATS 48 进行选择。“标准”或“重载”型应用定义了电流限定值和电机负载 S1 和 S4 周期。

注意: ATS 48 不要使用电机之外的其他负载(例如禁止使用变压器和电阻器)。

不要将功率因数校正电容连接在由 ATS 48 控制的电机的端子上。

标准应用

例如: 离心泵

在标准应用中, ATS 48 设计能够提供如下功能:

- 在 S1 负荷中: 冷态以 $4I_n$ 电流持续 23 秒或 $3I_n$ 电流持续 46 秒起动。
- 在 S4 负荷中: 负载系数 50%, 每小时起动 10 次, 以 $3I_n$ 持续 23 秒或 $4I_n$ 电流起动 12 秒, 或与此相当的热循环。

在此情况下, 电机热保护必须符合 10 级保护等级。

重载应用

例如: 研磨机

在重载应用中, ATS 48 设计用于 S4 负荷, 负载系数为 50%, 每小时起动 5 次, 电流 $4I_n$ 持续 23 秒或与此相当的热循环。

在此情况下, 电机热保护必须符合 20 级保护等级。电流 I_n 决不能保持在出厂设定值, 而必须设定为电机铭牌上所示的值。

注: 起动器选型可以选大一级, 例如对 11kW-400V、以电机负荷 S4 运行的电机可选用 ATS 48D17Q。

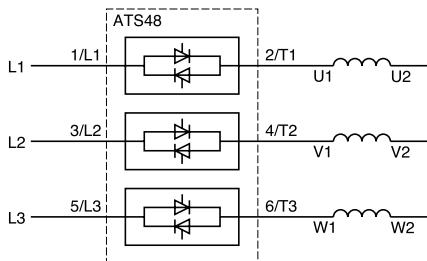

为此, 应在起动过程结束时将 ATS 48 短路。允许每小时起动 10 次, 3 倍 I_n 电流最长持续 23 秒或相当的热循环, 电机热保护必须符合 10 级要求。

ATS 48Q 系列 (230-400V) 与电机直接连接或连接到电机三角形绕组

ATS 48 连接在电机电源线中

电机连接取决于电源电压，在本例中为星形连接。

电机连接取决于电源电压，在本例中为三角形连接。

操作建议

ATS 48Q 系列 (230-400V) 连接到电机三角形绕组，与每一绕组串联

ATS48***Q 或 ATS48***YS316 起动器可以串联接入电机三角形绕组中。它们由 1/ 线电流的电流驱动，这样可以使用低额定值的起动器。

此选项可以在高级设定菜单 (Advanced settings menu) 中进行配置 (dLt=On)。

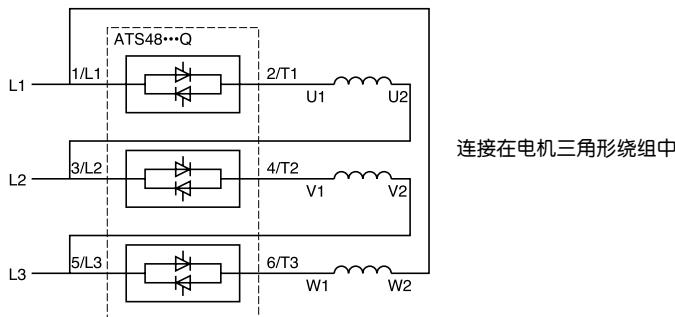

额定电流和限制电流设定值以及运行过程中显示的电流均为在线值，因此不需要由用户自己计算。

对于 ATS48 系列软起动器，ATS48***Q 或 ATS48***YS316 都可以串联连接在电机三角形绕组中。
内三角连接时：

- 不能选择动态制动停机
- 不能使用级联功能
- 不能使用预热功能

关于起动器 - 电机组合的更多信息可参见第 12 页表格。

例如：

1台 400V-110kW 电机，线电流 195A (三角形连接的额定电流)。

每一绕组中的电流等于 $195/1.7$ ，即 114A。

选择最大允许额定电流稍大于此电流的额定值，即 140A 作为额定值 (ATS48C14Q 用于标准应用)。

为避免计算额定值，可以使用 14 和 15 页的表，表中给出对应于每种应用类型电机功率的起动器额定值。

温度降容

上表中的值是根据最高环境温度 40°C 时的运行情况给出的。

ATS 48 最高可以在 60°C 环境温度下使用, 40°C 以上每升高 1°C, 20 级最大允许电流降低 2% 即可。

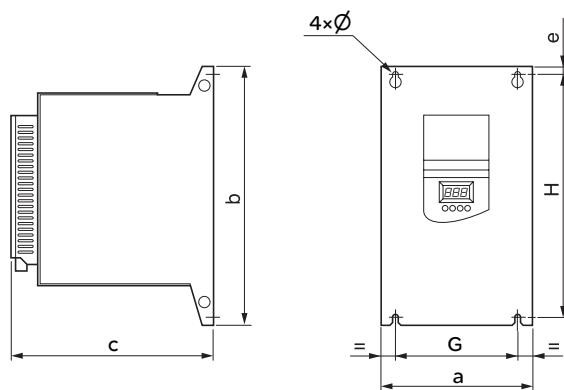

例如: ATS 48D32Y 在 50°C 下运行, 则应降容 $10 \times 2\% = 20\%$, 22A 变为 $22 \times 0.8 = 17.6A$ (最大电机额定电流)

接线指导

电源接线

按照标准中推荐的电缆截面积选用电缆。

起动器必须接地以符合有关漏电流的规范。当安装标准要求使用进线，“残余电流设备”用于保护时，必须使用一个 A-Si 类型设备（避免上电过程中出现意外脱扣）。检查它与其他保护设备的兼容性。如果安装中有若干起动器连接在同一条线上的情况，则每个起动器必须单独接地。如有必要，应安装一个进线电抗器（参见产品目录）。

动力电缆应与弱电信号（检测器、PLC、测量仪表、视频、电话）电路保持隔离。

控制接线

控制线与动力电缆应保持隔离。

RUN(运行) 和 STOP(停机) 逻辑输入端的功能 (见 30 页应用接线图)

2 线控制

运行和停机是由状态 1(运行) 和 0(停机) 进行控制， RUN 和 STOP 输入状态同时考虑。

在上电或故障手动复位时如果有 RUN 命令则电机重新起动。

3 线控制

运行和停机由 2 个不同的逻辑输入端控制。

断开 (状态 0) STOP 输入可获得停机。

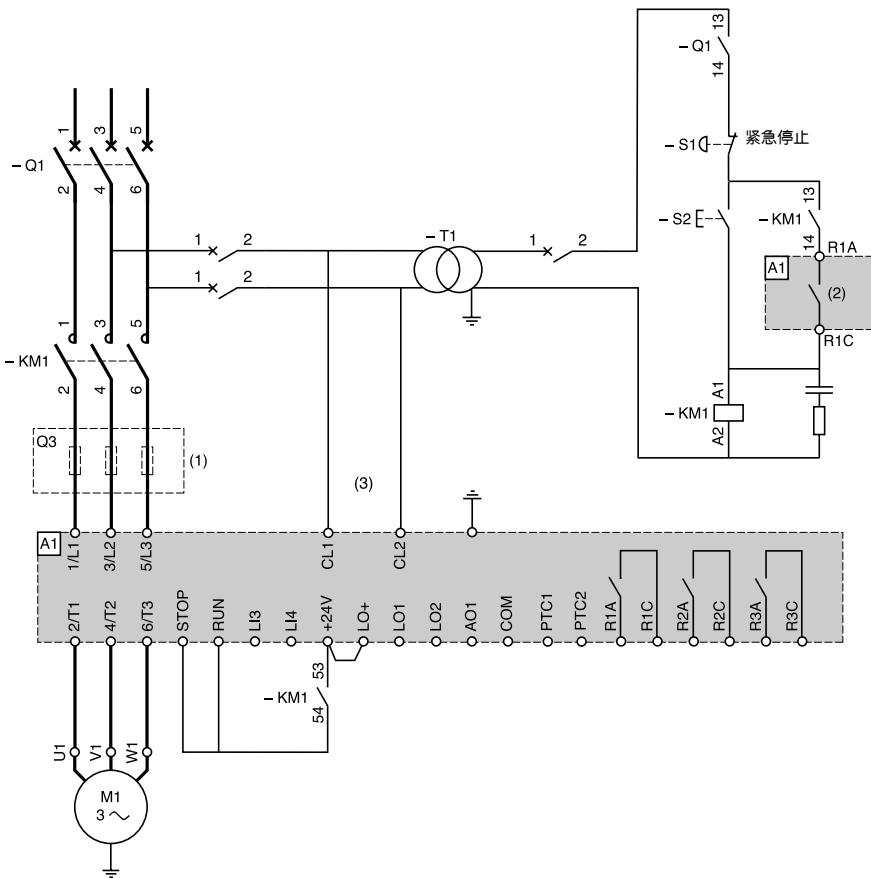

在 RUN 输入端的脉冲一直存储到停机输入断开为止。

在上电或故障手动复位时或在一个停机命令之后，电机只能在 RUN 输入端已断开 (状态 0) 之后跟着一个新脉冲 (状态 1) 时才能上电。

完整操作顺序说明

按下 MST 起动按钮, KM1 线圈得电(进线接触器), 主触头闭合

1 - 2 - 3

按 BPM1 起动电机 1。按 BPM2 起动电机 2, 按 BPMn 起动电机 n。

当按下 BPM1 时, KAM1 得电, 如 KM11 一样, 因为 ACDEC 被激活(ATS48 由 MST 和 KM1 供电)。因为 KM1 闭合, KA 得电。在一段可调的延时后 KAT 也会得电。

4 - 5

ATS48 在有 KA 和 KAT 吸合后, RUN 端子施加运行命令后将会起动电机。

KAM1 由于 KAT 常闭触点打开失电。

KM11 保持闭合。

6 - 7

在起动结束时, R2 在 ATS48 得电, SHUNT 闭合, KM12 被 SHUNT 闭合, 而 KM11 保持闭合。

8 - 9

在较短的一段时间之后, R2 在 R1 之后失电(起动器旁路功能)。

由于 ACDEC 断开, KM11 断开。

电机继续由 KM12 供电。

ATS48 显示一个状态代码。

用同样的步骤起动下一个电机。起动电机 n 按下 BPMn, 按下 BPA_n 让电机 n 停机。各个电机可以以任何顺序起动和停止。

要使电机 1 停机, 按 BPA1, AR1 闭合

a - b - c - d

K 和 KAL1 闭合。

ATS48 上的 LI 从 KAL1 和 KALIT 上接收一个命令(LI 必须调整至 LIC 值)。

ATS48 上 R1 和 R2 得电动作(R2 为脉冲信号, R1 保持闭合直到电机完全停下来)。

e

KM11 闭合。

在一段可调的时延之后, KT 和 KALIT 得电。

f

ATS48 从 KALIT 接受一个停机指令。

g

KM12 失电。

ATS48 使电机减速。

h

当电机完全停下来后 ATS48 上 R1 断开。

i

热保护

起动器热保护

通过安装在散热器上的 PTC 传感器和计算晶闸管的温升提供热保护。

电机热保护

起动器会根据受控制的额定电流 I_{n} 和实际吸收的电流持续地计算电机的温升。

温升可能由长时间或短时间的欠载或过载引起。下面几页上的脱扣曲线是基于起动电流 I_{s} 和电机电流 I_{n} (可调整的) 做出的。

IEC60947-4-2 标准定义了保护等级，它给出了电机的无热故障起动能力(热起动或冷起动)。对 COLD (冷) 状态(对应于稳定的电机热状态, 断电) 和 WARM (热) 状态(对应于一个稳定的电机热状态, 在额定功率下) 给出了不同的保护等级。

起动器出厂设置为 10 级保护。

可以使用 Pro 菜单修改保护等级。

起动器显示的热保护对应于加热时间常数 (iron time constant)。

- 如果电机超过了其额定温升阈值(电机热状态 =110%) 则激活过载报警。
- 如果超过了临界温升阈值(电机热状态 =125%) 热故障将使电机停机。

在出现起动延长时, 即使显示的值低于脱扣值起动器也能由故障或热报警脱扣。

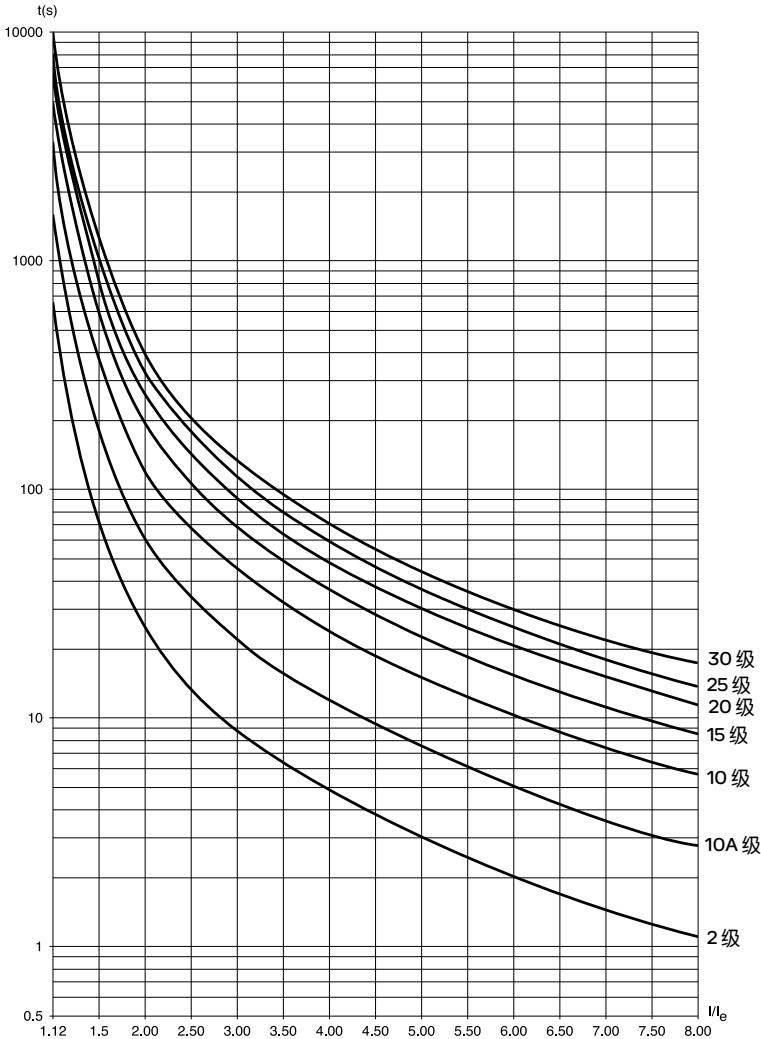

如果没有禁止热保护, 则热故障可以由继电器 R1 指示。

在电机已经停机或起动器已被断电后, 即使控制电路断电也仍然会计算热状态。ATS 热控制系统可以防止在电机温升过高的情况下重新起动电机。

如果使用特殊的电机(防火、水下的等等), 则应由 PTC 传感器提供热保护。

使用 PTC 传感器的电机热保护

集成在电机中用以测量其温度的 PTC 传感器可以连接到控制卡端口上，这个模拟值由起动器进行管理。

“PTC probe thermal overshoot” (PTC 传感器热过冲) 参数值可通过两种方式进行处理和使用：

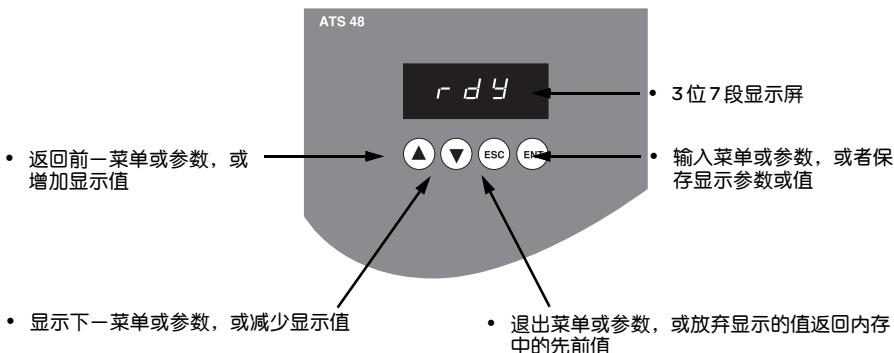

- 如果该信号有效，出现故障时停机
- 如果该信号有效，给出报警。该报警可以显示在起动器状态字(串口)中或可配置逻辑输出

注意：

PTC 传感器保护不会禁止通过计算给出的电机热保护。两种类型的保护可以并行工作。

文

VW3 G48101 远程操作盘可以安装在壁挂式或落地式安装的封装门上，带有密封条能够提供 IP 65 防护。它有一条 3m 长的带接头的电缆，通过起动器上的 RJ45/Modbus 接口进行通讯（见端子附带的手册）。它具有与 ATS 48 相同的显示屏和编程按钮，另外还添加了一个菜单访问锁定开关。

操作盘上的 3 位置开关应按如下原则使用：

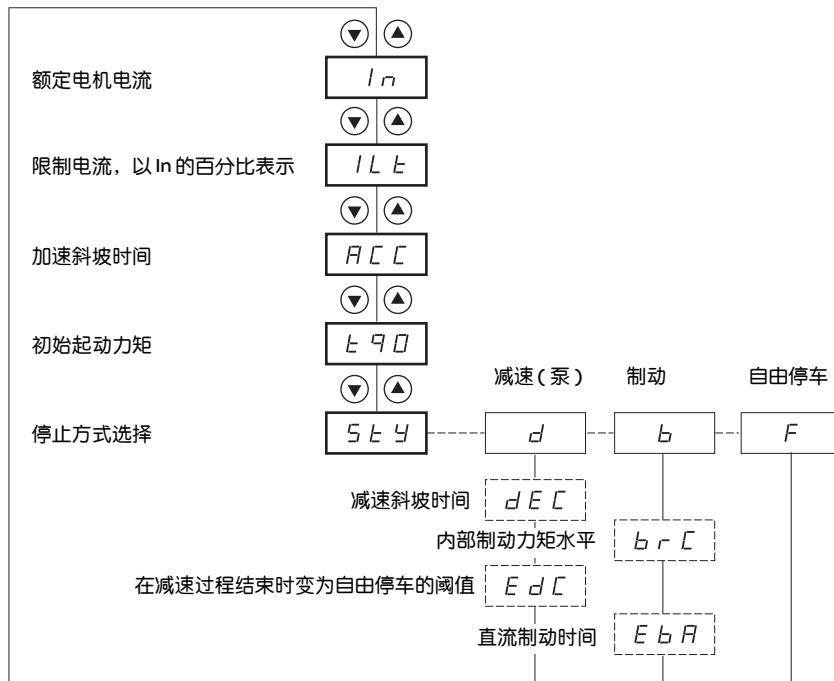

- 锁定位置 ：只有检测参数可以访问。当起动器正在运行时，不能选择显示不同的参数。
- 部分锁定位置 ：对 SEt, PrO 和 SUP 菜单参数进行有限的访问。
- 解锁位置 ：所有参数均可访问。

任何有远程操作盘开关施加给起动器的显示限制在起动器已断开连接甚至以关机后仍然起作用。

SSt	小型电机测试 要在测试或维护环境中对起动器进行检查，使用功率远小于起动器额定值的电机（特别是对于大功率的起动器）。 力矩控制参数 CLP 自动无效。 - OFF: 功能无效 - On: 功能有效 控制电压一断开 SSt 即返回 OFF 状态。在下一次起动时，PHF 故障和 CLP 参数将会返回其初始配置。	On - OFF	OFF
CLP	力矩控制 (控制类型) - OFF: 功能无效 - On: 功能有效 在 On 位置，起动和减速按照力矩斜坡进行。 在 OFF 位置，起动和减速由电压的变化进行控制。 对于多个电机并接在一个起动器上，或电机功率相对于起动器额定值非常小（用小型号电机测试起动器）的情况下，建议使用电压控制 (CLP=OFF)。	On - OFF	On
LSC	定子损耗补偿 参数在加速阶段（或当 StY=-d- 时的减速阶段）有效。 在出现力矩振荡的情况下，应逐步降低这个参数的值，直至设备正常运行为止。 在起动器与电机按三角形接法连接或滑差率大的电机中振荡是最常见的现象。	0 至 90%	50%
tIG	减速增益 (用于力矩控制) 此参数仅在 CLP=On 或 StY 参数 (Set 设定菜单) =-d- 时才可访问。 可用于消除减速过程中的不稳定性。 应根据振荡情况调整这一参数。	10 至 50%	40%
LSC	级联功能激活 见 38 页 - On: 功能有效 - OFF: 功能无效 仅当继电器 R1 已事先定义为“隔离继电器”功能，或未配置“强制自由停车”、“起动器三角形接法”以及“预热”功能时可以访问此参数。 定义一个输入端 LI=LIC。 最多 255 个电机。	On - OFF	OFF

I/O 参数只能在电机停机时进行修改。

代码	说明	设定范围	出厂设定
L13 L14	逻辑输入 如果输入端已通电，则所选功能有效。 - no: 未定义 - LIA: 一旦接收到一个 STOP 命令即进行强制自由停车。如果 drC 菜单中的 CSC 参数设为 “ON” 则此选项不会出现。它将强制使用自由停车，但不会对停车进行控制。 - LIE: 外部故障。允许起动器检测外部用户故障(水位、压力等)。电机进行自动停车且起动器显示 Err。 - LIH: (1) 电机预热。如果 drC 菜单中的 CSC 参数设为 “ON” 则此选项不会出现。用于防止电机结冰或可能导致冷凝的温度漂移。如果此输入有效，则当电机停机并经过一段可调整的延时之后，将会有一次可调整的电流 IPr 通入电机。该电流对电机进行加热但不会使其转动。IPr 和 tbr 必须进行调整(见下图)。		LIA LIL
			

当该输入端激活且电机已停机、且已经过延时 tPr 和 tbS 后，预热开始。如果该输入被禁止、发送了运行命令或激活了 STOP 输入端，则预热停止。

- LIL: 强制为本地控制模式。如果使用了串口，则从线路模式(通过串口控制)转为本地模式(通过终端控制)。
- LII: (1) 禁止所有保护。警告：这类应用将使起动器质保失效。用于在紧急情况下对起动器进行控制(例如烟雾抽取系统)。
- LIt: 重置电机热故障
- LIC: 级联功能激活。在这种情况下电机热保护被禁止且继电器 R1 必须配置为隔离继电器。可用于单个起动器对若干相同电机的顺次起动和减速(见应用接线图)。
- LIr: 复位可以被复位的故障
- LIS: 第 2 组电机参数激活。用于对两台不同的电机逐个进行起动和减速，或用单个起动器对一台电机进行两种不同配置的起动或减速。

- (1) 为使此定义生效，ENT 必须按下 10s(显示屏闪烁以示确认)。
 此参数不能通过远程操作盘进行修改。

As a rule, the ATS 48 control (CL1 - CL2) and power (1/L1 - 3/L2 - 5/L3) supplies must be disconnected before any operation on either the electrical or mechanical parts of the installation or machine.

During operation the motor can be stopped by cancelling the run command. The starter remains powered up. If personnel safety requires prevention of sudden restarts, this electronic locking system is not sufficient: fit a breaker on the power circuit.

The starter is fitted with safety devices which, in the event of a fault, can stop the starter and consequently the motor. The motor itself may be stopped by a mechanical blockage. Finally, voltage variations or line supply failures can also cause shutdowns.

If the cause of the shutdown disappears, there is a risk of restarting which may endanger certain machines or installations, especially those which must conform to safety regulations.

In this case the user must take precautions against the possibility of restarts, in particular by using a low speed detector to cut off power to the starter if the motor performs an unprogrammed shutdown.

The products and equipment described in this document may be changed or modified at any time, either from a technical point of view or in the way they are operated. Their description can in no way be considered contractual.

This starter must be installed and set up in accordance with both international and national standards. Bringing the device into conformity is the responsibility of the systems integrator who must observe the EMC directive among others within the European Union.

The specifications contained in this document must be applied in order to comply with the essential requirements of the EMC directive.

The ATS 48 must be considered as a component: it is neither a machine nor a device ready for use in accordance with European directives (machinery directive and electromagnetic compatibility directive). It is the responsibility of the final integrator to guarantee conformity to the relevant standards.

Steps for setting up the starter

ENGLISH

1 – Delivery of the ATS 48

- Check that the starter reference printed on the label is the same as that on the delivery note corresponding to the purchase order.
- Remove the ATS 48 from its packaging and check that it has not been damaged in transit.

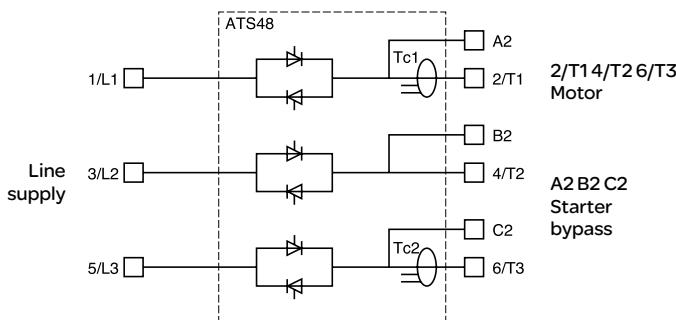

2 - Fit the ATS 48 in accordance with the recommendations on page 102 and page 103

3 - Connect the following to the ATS 48:

- The control line supply (CL1 – CL2), ensuring that it is off
- The power line supply (1/L1 - 3/L2 - 5/L3), ensuring that it is off
- The motor (2/T1 - 4/T2 - 6/T3), ensuring that its coupling corresponds to the supply voltage

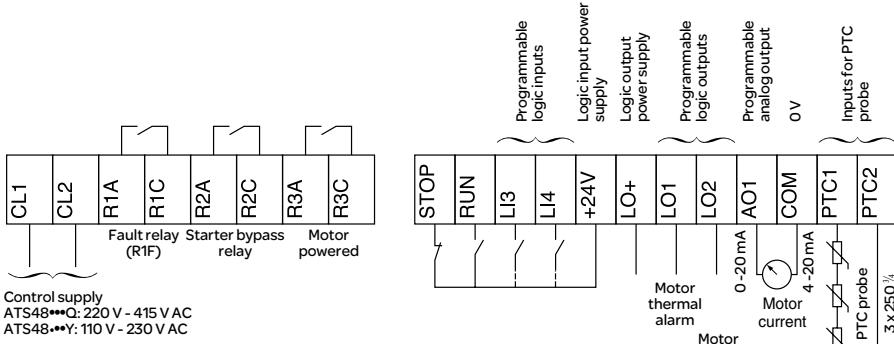

Note: If a bypass contactor is used, connect it to L1 L2 L3 on the line supply side and to terminals A2 B2 C2 provided for this purpose on the ATS 48. See the diagrams on page 112.
If the ATS48***Q / ATS48***YS316 is used in the motor delta windings, follow the recommendations on page 92, page 93 and the diagrams on page 113.

Block diagram of the power part of the ATS48:

Steps for setting up the starter

Factory configuration of the control terminals:

Wire the fault relay in the line contactor power supply sequence in order to open the electrical circuit in the event of a fault.

For further details refer to the application diagrams.

Connect the RUN and STOP commands and if necessary the other terminal inputs/outputs.

Stop at 1(on) and RUN at 1(on): start command.

Stop at 0(off) and RUN at 1 or at 0: stop command.

4 - Essential information before starting up the ATS 48:

Read the information on the motor rating plate. The values will be used to set parameter (In) in the SET menu.

5 - Powering up the control part (CL1-CL2) without the power part and without giving the run command

The starter displays: nLP (to indicate that the power is switched off).

The ATS 48 starter is factory-configured for a standard application which does not require specific functions. It has motor protection class 10.

The settings can be changed by accessing the parameters as described on page 126.

In all cases the In parameter must be set to the current value indicated on the motor rating plate.

6 - Powering up the power part (1/L1 - 3/L2 - 5/L3)

The starter displays: rdY (to indicate that the starter is powered up and ready).

Send a "RUN" command to start the system.

 - Connected via the serial link, the starter has the logic address (Add) = "0"
 - Transmission speed (tbr): 19200 bits per second
 - Communication format (FOr): 8 bits, no parity, 1 stop bit (8nl)

If the above values are compatible with the application, the starter can be used without changing the settings.

Preliminary recommendations

ENGLISH

Handling and storage

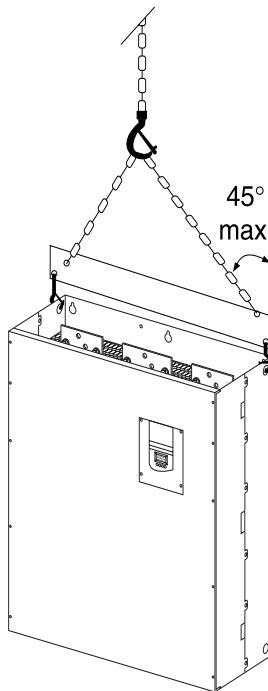

To ensure the starter is protected before installation, handle and store the device in its packaging.

Handling on installation

The ATS 48 range comprises 6 sizes of device, with various weights and dimensions.

Small starters can be removed from their packaging and installed without a handling device.

A handling device must be used with large starters; for this reason they are supplied with handling "lugs". The precautions described below must be observed:

Do not handle the starter by the power rails

Operating recommendations

Available torque

Curves T_s and I_s represent the direct line starting of an asynchronous motor.

Curve T_{a1} indicates the total torque range available with an ATS 48, which is dependent on the limiting current I_{Lt} . The progression of the starter is controlled by the motor torque within this range.

Tr: Resistive torque, which must always be less than the T_{s1} torque.

ENGLISH

Selecting the soft start - soft stop unit

S1 motor duty corresponds to starting followed by operation at constant load enabling the thermal equilibrium to be reached.

S4 motor duty corresponds to a cycle comprising starting, operation at constant load and an idle period. This cycle is characterised by a load factor.

The ATS 48 must be selected depending on the type of application ("standard" or "severe") and the nominal power of the motor. "Standard" or "severe" applications define the limiting values of the current and the cycle for motor duties S1 and S4.

Caution: Do not use the ATS 48 upstream of loads other than motors (for example transformers and resistors are forbidden). Do not connect power factor correction capacitors to the terminals of a motor controlled by an ATS 48

Standard application

Example: centrifugal pump

In standard applications, the ATS 48 is designed to provide:

- in S1 duty: starting at 4 In for 23 seconds or starting at 3 In for 46 seconds from a cold state.
- in S4 duty: a load factor of 50% and 10 starts per hour, with 3 In for 23 seconds or 4 In for 12 seconds or an equivalent thermal cycle.

In this case, the motor thermal protection must conform to protection class 10.

Severe application

Example: grinder

In severe applications, the ATS 48 is designed for S4 duty with a load factor of 50% and 5 starts per hour at 4 In for 23 seconds or an equivalent thermal cycle.

In this case, the motor thermal protection must conform to protection class 20. Current **In must not remain at its factory setting** but must be set to the value indicated on the motor rating plate.

Note: The starter can be oversized by one rating, for example by selecting an ATS 48D17Q for an 11 kW - 400 V motor in motor duty S4.

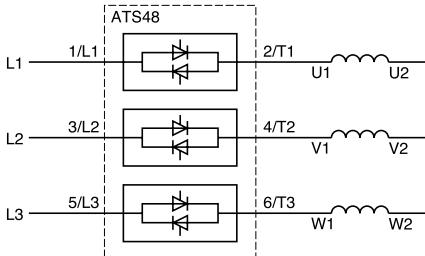

To do this, short-circuit the ATS at the end of starting. This permits 10 starts per hour at 3 times In for 23 seconds maximum or equivalent and the thermal motor protection must conform to class 10.

Operating recommendations

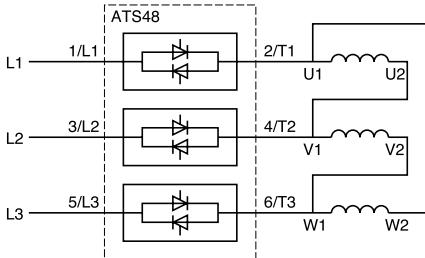

ENGLISH

The ATS 48 Q range (230-415 V) connected in line with the motor or in the motor delta winding

The ATS 48 connected in the motor supply line

The motor connection depends on the supply voltage, which in this example is a star connection.

The motor connection depends on the supply voltage, which in this example is a delta connection.

Operating recommendations

The ATS 48 connected in the motor delta winding in series with each winding

ATS48***Q or ATS48***YS316 starters connected to motors with delta connections can be inserted in series in the motor windings. They are powered by a current which is less than the line current by a factor of $\sqrt{3}$, which enables a starter with a lower rating to be used.

This option can be configured in the Advanced settings menu (dLt = On).

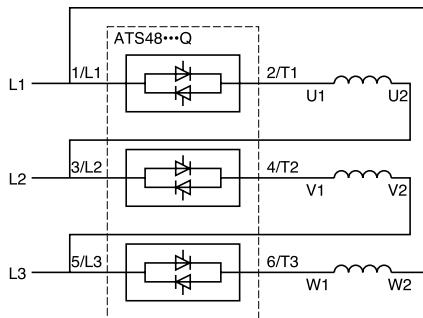

The nominal current and limiting current settings as well as the current displayed during operation are on-line values and so do not have to be calculated by the user.

The Altistart 48 can only be connected in the motor delta winding for ATS48***Q or ATS48***YS316 starters. This means that:

- dynamic braking stop is not possible
- cascading is not possible
- preheating is not possible

See the tables on page 94 for more information about starter-motor combinations.

Connection in the motor delta winding

Example:

A 400 V - 110 kW motor with a line current of 195 A (nominal current for the delta connection).

The current in each winding is equal to $195/1.7$ or 114 A.

The rating is determined by selecting the starter with a maximum permanent nominal current just above this current, i.e. 140 A (ATS48C14Q for a standard application).

To avoid having to calculate the rating in this way, use the tables on page 96 and 97 which indicate the rating of the starter corresponding to the motor power for each application type.

(1) Value not indicated when there is no corresponding standardised motor.

Temperature derating

The information in the table above is based on operation at a maximum ambient temperature of 40°C. The ATS 48 can be used up to an ambient temperature of 60°C as long as the max. permanent current in class 10 is derated by 2% for each degree above 40°C.

Example: ATS 48D32Q at 50°C derated by $10 \times 2\% = 20\%$, 32 A becomes $32 \times 0.8 = 25.6$ A (max. nominal motor current).

Mounting recommendations

Install the unit vertically, at $\pm 10^\circ$.

Do not install the unit close to, especially above, heating elements.

Leave sufficient free space to ensure that the air required for cooling purposes can circulate from the bottom to the top of the unit.

Starter ventilation

On starters fitted with a cooling fan, the fan is switched on automatically as soon as the heatsink temperature reaches 50°C . It is switched off when the temperature falls back to 40°C .

Mounting in a wall-fixing or floor-standing enclosure

Metal wall-fixing or floor-standing enclosure with IP 23 degree of protection

Observe the mounting recommendations on the previous page.

To ensure proper air circulation in the drive:

- Fit ventilation grilles.
- Ensure that ventilation is adequate: if not install a forced ventilation unit, with a filter if necessary.

Wiring recommendations

Power

Observe the cable cross-sectional areas recommended in the standards.

The starter must be earthed to conform to the regulations concerning leakage currents. When the use of an upstream "residual current device" for protection is required by the installation standards, an A-Si type device must be used (to avoid accidental tripping during power up). Check its compatibility with the other protective devices. If the installation involves several starters on the same line, each starter must be earthed separately. If necessary, fit a line choke (consult the catalogue).

Keep the power cables separate from circuits in the installation with low-level signals (detectors, PLCs, measuring apparatus, video, telephone).

Control

Keep the control circuits away from the power cables.

Functions of the RUN and STOP logic inputs

(See application diagram see

page 112)

2-wire control

Run and stop are controlled by state 1 (run) or 0 (stop), which is taken into account at the same time on the RUN and STOP inputs.

On power-up or a manual fault reset the motor will restart if the RUN command is present.

3-wire control

Run and stop are controlled by 2 different logic inputs.

A stop is obtained on opening (state 0) the STOP input.

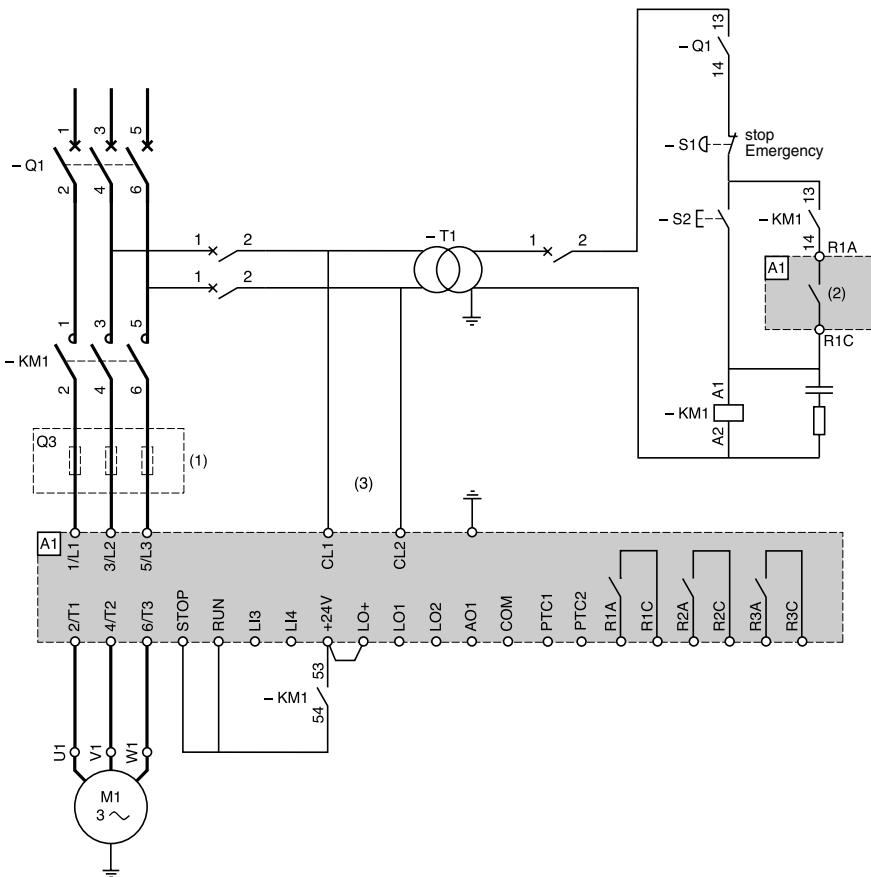

The pulse on the RUN input is stored until the stop input opens.

On power-up or a manual fault reset or after a stop command, the motor can only be powered once the RUN input has been opened (state 0) followed by a new pulse (state 1).

Description of the complete sequence

Start with MST so that KM1 rises (line contactor)

1 - 2 - 3

Press BPM1 to start motor 1. Press BPM2 to start motor 2, press BPMn to start motor n.

When BPM1 is pressed, KAM1 rises, as does KM11 because ACDEC is activated (the ATS48 is powered by MST and KM1).

KA rises because KAM1 is closed. KAT also rises after an adjustable time delay.

4 - 5

The ATS48 starts the motor following a run command on RUN with KA and KAT.

KAM1 drops out due to KAT.

KM11 remains closed.

6 - 7

At the end of starting, R2 on the ATS48 rises, SHUNT is closed, KM12 is closed by SHUNT and KM11 remains closed.

8 - 9

After a short time R2 drops out followed by R1 (starter bypass function).

KM11 opens because ACDEC is open.

The motor continues to be powered by KM12.

ATS48 display a status code.

Follow the same procedure to start the next motor. To start motor n use BPMn and to stop motor n use BPA_n. The motors can be started and stopped in any order.

To stop motor 1 press BPA1. AR1 closes

a - b - c - d

K and KAL1 are closed.

LI on the ATS48 receives a command from KAL1 and KALIT (LI must be adjusted to value LIC).

R1 and R2 on the ATS48 rise (a pulse on R2 and R1 remains closed until the motor has come to a complete stop).

e

KM11 closes.

After an adjustable time delay, KT and KALIT rise.

f

The ATS48 receives a stop command from KALIT.

g

KM12 drops out.

The ATS48 decelerates the motor.

h

R1 on the ATS48 opens when the motor has come to a complete stop.

i

KM11 opens.

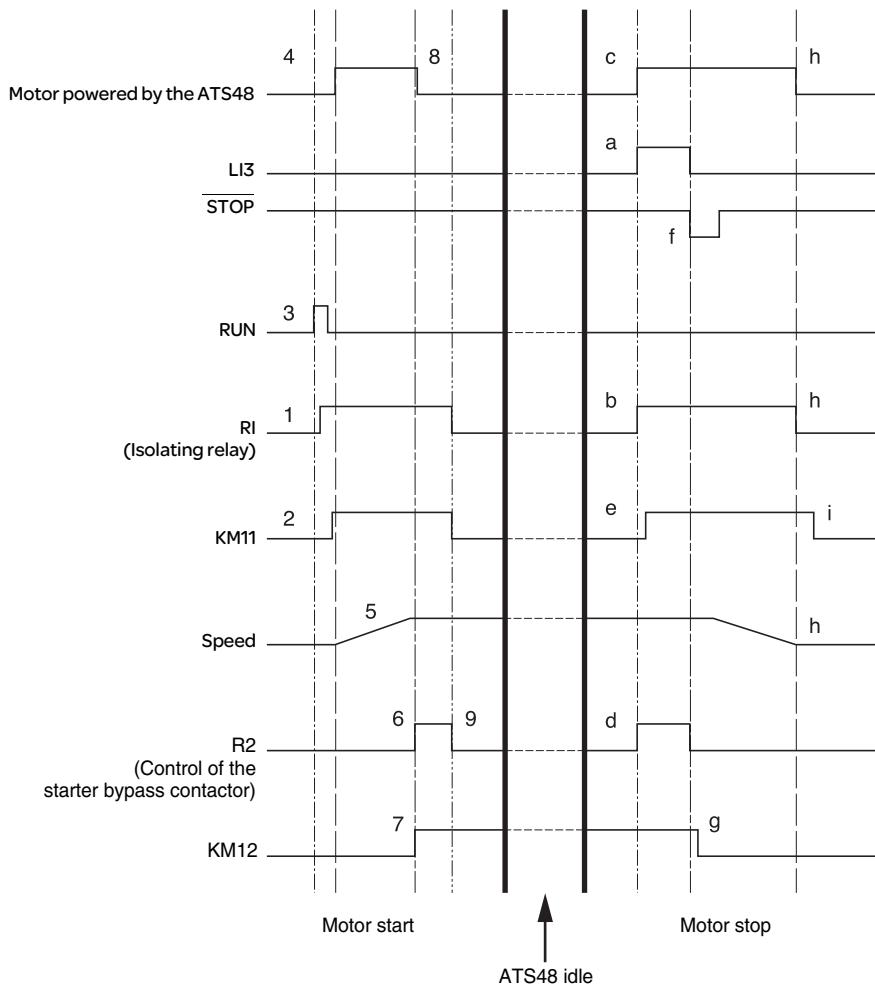

The ATS48 is ready to start or stop another motor.

Starter thermal protection

Thermal protection is provided by the PTC probe fitted on the heatsink and by calculating the temperature rise of the thyristors.

Motor thermal protection

The starter continuously calculates the temperature rise of the motor based on the controlled nominal current I_n and the actual current absorbed.

Temperature rises can be caused by a low or high overload with a long or short duration. The tripping curves on the following pages are based on the relationship between the starting current I_s and the (adjustable) motor current I_n .

Standard IEC60947-4-2 defines the protection classes giving the starting capacities of the motor (warm or cold start) without thermal faults. Different protection classes are given for a COLD state (corresponding to a stabilised motor thermal state, switched off) and for a WARM state (corresponding to a stabilised motor thermal state, at nominal power).

The starter is factory-set to protection class 10.

This protection class can be modified using the PrO menu.

The thermal protection displayed by the starter corresponds to the iron time constant.

- An overload alarm is activated if the motor exceeds its nominal temperature rise threshold (motor thermal state = 110%).
- A thermal fault stops the motor if it exceeds the critical temperature rise threshold (motor thermal state = 125%).

In the event of a prolonged start, the starter can trip on a fault or thermal alarm even if the value displayed is less than the trip value.

The thermal fault can be indicated by relay R1 if thermal protection has not been disabled.

After the motor has stopped or the starter has been switched off, the thermal state is calculated even if the control circuit is not powered. The ATS thermal control prevents the motor from restarting if the temperature rise is too high.

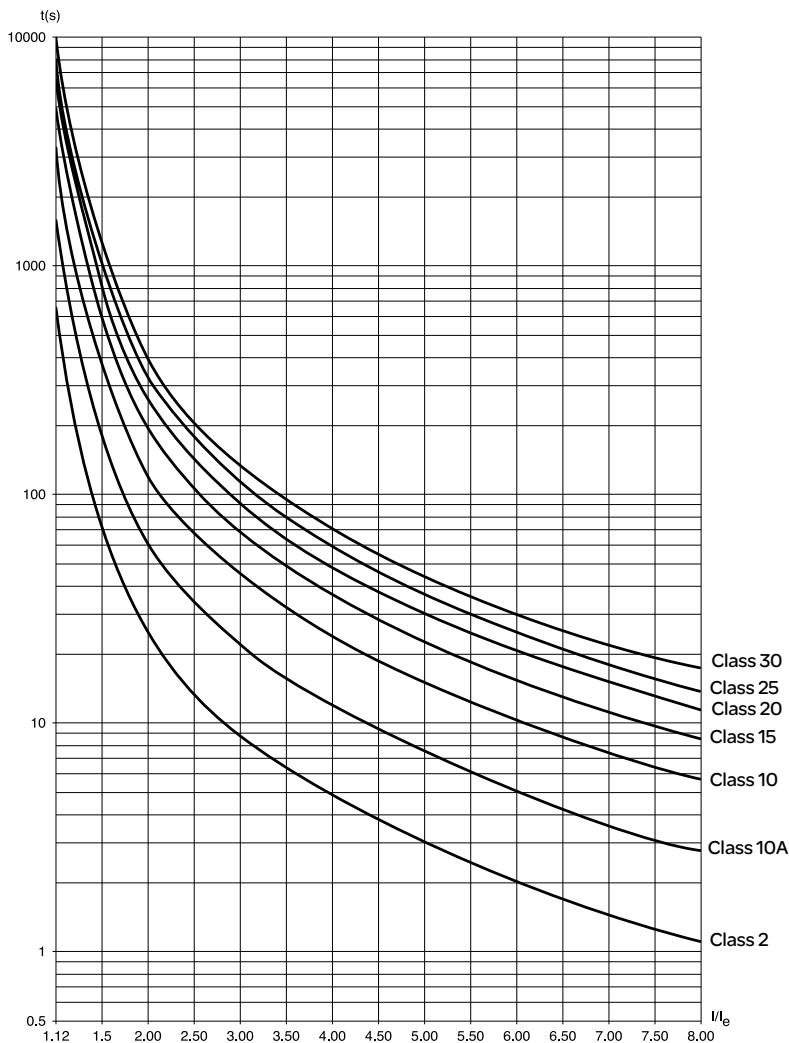

If a special motor is used (flameproof, submersible, etc.) thermal protection should be provided by PTC probes.

Motor thermal protection with PTC probes

PTC probes integrated in the motor to measure its temperature can be connected to the control card terminals. This analog value is managed by the starter.

The "PTC probe thermal overshoot" value can be processed and used in two ways:

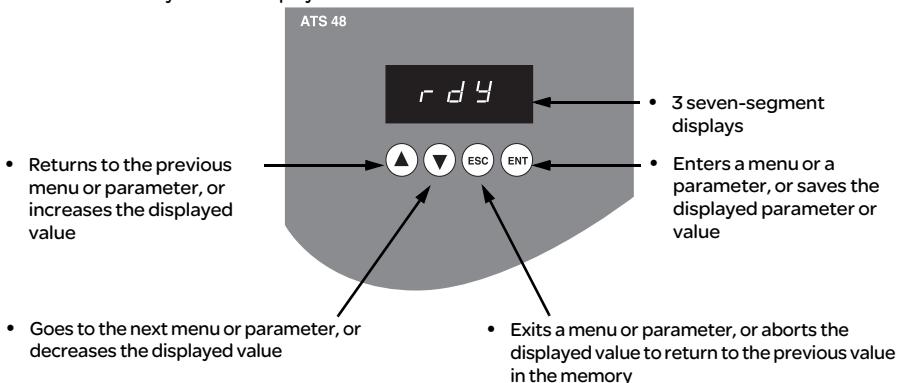

- stop in the event of a fault if the signal is active
- activate an alarm if the signal is active. This alarm can be displayed in a starter status word (serial link) or on a configurable logic output.

Note:

PTC probe protection does not deactivate the motor thermal protection provided by the calculation. Both types of protection can operate in parallel.

The displayed value "XXX" follows the following rules:

Value displayed	Condition
Fault code	Faulty starter
nLP rdY	Starter without run command and: • Power not supplied • Power supplied
tbS	Starting time delay not elapsed
HEA	Motor heating in progress
Monitoring parameter selected by the user (SUP menu). Factory setting: motor current	Starter with run command

Stb	Waiting for a command (RUN or STOP) in cascade mode

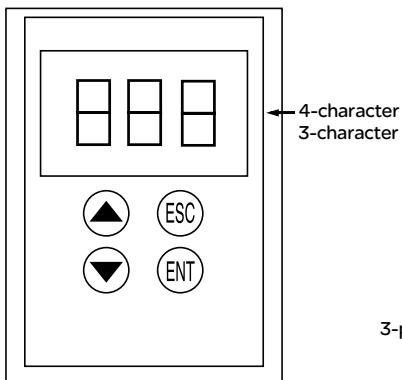

When current limiting is applied to the starter, the displayed value "XXX" flashes.

It is still possible to modify the parameters even if a fault occurs on the starter.

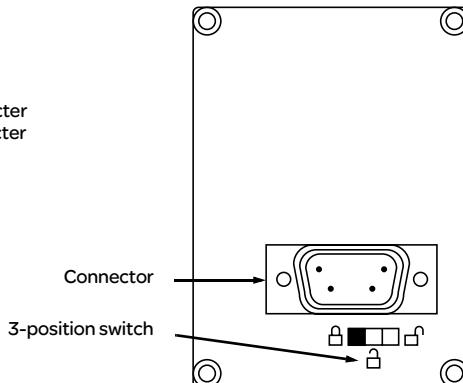

Remote terminal option

The VW3 G48101 remote terminal can be mounted on the door of the wall-mounted or floor-standing enclosure with a seal which offers IP 65 protection. It has a 3 m cable with connectors and communication is via the RJ45/Modbus connection on the starter (see the manual supplied with the terminal). It has the same display and the same programming buttons as the ATS 48 with the addition of a menu access locking switch.

View of the front panel:

View of the rear panel:

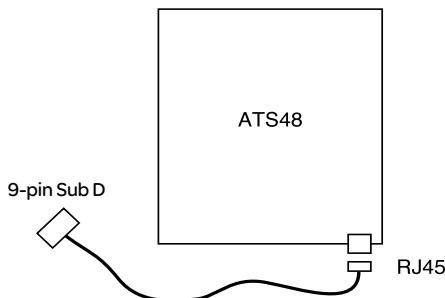

Control of the remote terminal switch

The 3-position switch on the terminal is used as follows:

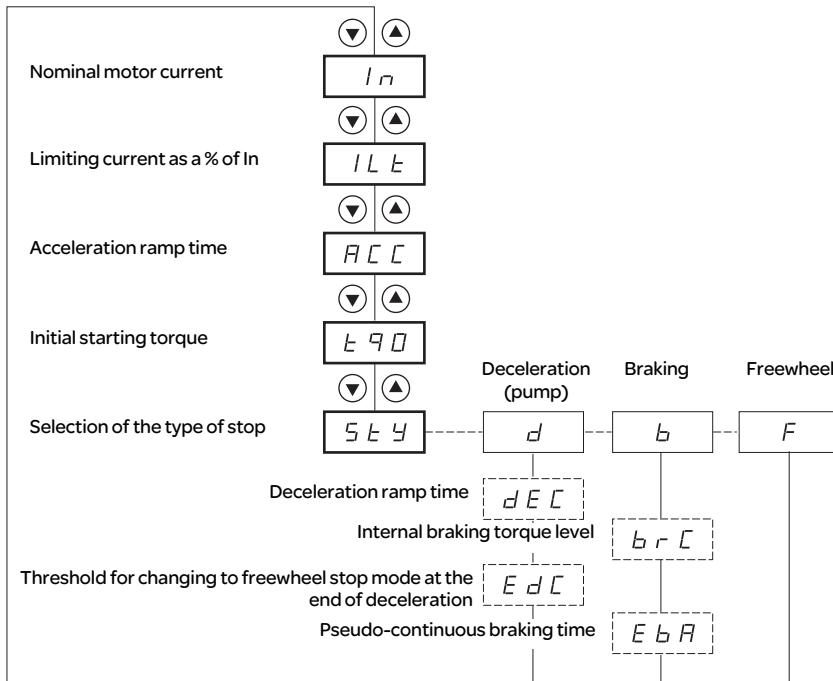

- locked position :only the monitoring parameters can be accessed. When the starter is running, it is not possible to select a different parameter to be displayed.
- partly locked position :limited access to the SEt, PrO and SUP menu parameters.
- unlocked position :all parameters can be accessed.

Any display restrictions applied to the starter by the remote terminal switch will still be in force once the starter has been disconnected and even after it has been switched off.

SSt	Tests on small motor To check the starter in a testing or maintenance environment, on a motor whose power is very much lower than the starter rating (in particular for high power starters). The torque control parameter CLP is automatically deactivated. - OFF: function inactive - On: function active SSt returns to the OFF state as soon as the control voltage is disconnected. On the next power up, the PHF fault and the CLP parameter return to their initial configuration.	On - OFF	OFF
CLP	Torque control (type of control) - OFF: function inactive - On: function active In the On position, starting and deceleration follow the torque ramp. In the OFF position, starting and deceleration are controlled by voltage variation. Voltage control is recommended for applications which use motors in parallel on one starter or a motor whose power is very low in relation to the starter rating (use of an undersized motor to test the starter) (CLP = OFF).	On-OFF	On
LSC	Stator loss compensation Parameter active in acceleration phases (and deceleration phases if StY = -d-). In the event of torque oscillations, reduce this parameter gradually until the device is functioning correctly. Oscillations are most common if the starter is connected in the motor delta winding or in motors with excessive slip.	0 to 90%	50%
tIG	Deceleration gain (for torque control) This parameter can only be accessed if CLP = On and if the StY parameter (SEt Settings menu) = -d-. Can be used to eliminate instability during deceleration. Adjust the parameter in accordance with the oscillations.	10 to 50%	40%
LSC	Activation of the cascade function See page 120 - On: function active - OFF: function inactive This parameter can only be accessed if relay R1 has previously been assigned to the "isolating relay" function and if the "forced freewheel stop", "starter in the motor delta winding" and "preheating" functions are not configured. Assign an input LI = LIC. 255 motors max.	On-OFF	OFF
ULn	Line voltage 170 to 460 V (ATS48**Q) 180 to 790 V (ATS48**Y) This parameter is used to calculate the power displayed (LPr and LAP parameters from the SUP menu). The display will only be accurate if this parameter has been set correctly.	400 V (ATS48**Q) 460 V (ATS48**Y)

L 13 L 14	Logic inputs The selected function is active if the input is powered up. - no: not assigned. - LIA: forced freewheel stop as soon as a STOP command is received. This selection does not appear if the CSC parameter in the drC menu is set to "On". Forces the configuration of a freewheel type stop, but does not control the stop. - LIE: external fault. Enables the starter to detect an external user fault (level, pressure, etc.). The motor comes to a freewheel stop and the starter displays EtF. - LIH: (1) motor preheating. This selection does not appear if the CSC parameter in the drC menu is set to "On". Used to prevent the motor from freezing or to prevent temperature deviations which may cause condensation. Once the motor has stopped an adjustable current IPr flows through it after an adjustable time delay tPr, if the input is active. This current heats the motor without causing it to rotate. IPr and tbr must be adjusted (see below).		LIA LIL

It shows five signals: Speed, RUN, LI, IPr current, tbS, and tPr. The Speed signal is high during RUN. The LI signal is high when the motor is stopped. The IPr current signal starts flowing when the LI signal goes high and the motor has stopped. The tbS signal is high during the initial start phase. The tPr signal is high during the preheating phase. A vertical dashed line marks the point where the motor has stopped.</p>		

Preheating starts when the input is activated and the motor has stopped, after time delays tPr and tbS (PrO menu) have elapsed. Preheating stops if the input is deactivated, if a run command is sent or if the STOP input is activated.

- LIL: force to local control mode. If a serial link is used, changes from line mode (control via serial link) to local mode (control via terminals).
- LII: (1) inhibits all protection. Warning: This type of use invalidates the starter warranty. Used to override the starter in the event of an emergency (smoke extraction system for example).
- LIt: reset motor thermal fault
- LIC: activation of the cascade function. In this case motor thermal protection is disabled and relay R1 must be configured as an isolating relay. Can be used to start and decelerate several identical motors one after the other with a single starter (see application diagram).
- LIr: reset faults which can be reset
- LIS: activation of second set of motor parameters. Used to start and decelerate two different motors one after the other or one motor with two different configurations using a single starter.

(1) In order for this assignment to take effect, ENT must be pressed for 10 s (confirmed by flashing display). **This parameter cannot be modified via the remote terminal.**

Servicing

The ATS 48 does not require any preventative maintenance. It is nevertheless advisable to perform the following regularly:

- Check the condition and tightness of connections
- Ensure that the temperature around the unit remains at an acceptable level and that ventilation is effective (average service life of fans: 3 to 5 years depending on the operating conditions)
- Remove any dust from the heatsink if necessary

Assistance with maintenance

If a problem arises during setup or operation, ensure that the recommendations relating to the environment, mounting and connections have been observed.

The first fault detected is memorized and displayed on the screen: the starter locks and relays R1 and R2 change state according to their assignment.

Clearing the fault

Switch off the starter power supply in the event of a fault which cannot be reset.

Wait for the display to go off completely.

Find the cause of the fault in order to correct it.

Restore the power supply: this clears the fault if it has disappeared.

In some cases there may be an automatic restart once the fault has disappeared if this function has been programmed.

Monitoring menu

This is used to prevent and find the causes of faults by displaying the starter status and its current values.

Spares and repairs

Consult Schneider Electric product support.

Faults - causes - remedies

Faults which can be manually reset

Fault displayed	Probable cause	Procedure, remedy
D t F	Motor thermal fault detected by the PTC probes	<ul style="list-style-type: none">Check the mechanism (wear, mechanical play, lubrication, blockages, etc.).Check the sizing of the starter-motor in relation to the mechanical requirement.Check the value of the PtC setting in the PrO menu page 137.Wait for the motor to cool before restarting.

L r F	Locked rotor in steady state This fault is only active in steady state with starter bypass contactor. It is detected if the current in a phase is greater than or equal to 5 In for more than 0.2 s.	<ul style="list-style-type: none">Check the mechanism (wear, mechanical play, lubrication, blockages, etc.).

Reset faults using a logic input

If a logic input LI is configured as "reset motor thermal fault" or "reset faults which can be reset", the following conditions must be met:

- A pulse on logic input LI
- In 2-wire control the motor will restart if the run command is maintained on the RUN input
- In 3-wire control the motor will restart on a new run command (rising edge) on the RUN input
